

ABSTRACT OF THE DISCLOSURE

The present invention relates to an apparatus to keep a safety brace in place on a cover, lid or door and a method of using the same. One aspect of the present invention includes an economical spring constructed to fit upon a safety brace in a way as to prevent the brace from being vibrated loose and allowing the cover, lid or door to close accidentally. Another aspect of the present invention is a method where the constructed spring is retrofitted upon an existing safety brace.
